Package 'WMWssp'

July 9, 2019

Type Package

Title Wilcoxon-Mann-Whitney Sample Size Planning

Version 0.4.0

Date 2019-07-09

Maintainer Martin Happ <martin.happ@aon.at>

Description Calculates the minimal sample size for the Wilcoxon-Mann-Whitney test
that is needed for a given power and two sided type I error rate. The method works for metric data with and without
ties, count data, ordered categorical data, and even dichotomous data.
But data is needed for the reference group to generate synthetic data for the treatment group based on a relevant effect.
For details, see Brunner, E., Bathke A. C. and Konietschke, F: Rank- and Pseudo-Rank Procedures in Factorial Designs - Using R and SAS, Springer Verlag, to appear.

R topics documented:

`WMWssp` *Sample size calculation for the Wilcoxon-Mann-Whitney test.*

Description

This function calculates the sample size for a given power, type-I error rate and allocation rate t = n_1/N. Additionally, the actual achieved power can be simulated.

Usage

```
WMWssp(x, y, alpha = 0.05, power = 0.8, t = 1/2,
  simulation = FALSE, nsim = 10^4)
```

Arguments

`x`	prior information for the first group
`y`	prior information for the second group
`alpha`	two sided type I error rate
`power`	power
`t`	proportion of subjects in the first group; or use t = "min" to use optimal proportion rate
`simulation`	TRUE if a power simulation should be carried out
`nsim`	number of simulations for the power simulation

Value

Returns an object from class WMWssp containing

`result`	A dataframe with the results.
`t`	The allocation rate which was used.
`alpha`	The type-I error rate which was used.
`simulation`	The achieved power in a simulation.
`power`	The power which was used.
`N`	The sample size needed.

Happ, M., Bathke, A. C., & Brunner, E. (2019). Optimal Sample Size Planning for the Wilcoxon-Mann-Whitney-Test. Statistics in medicine, 38(3), 363-375.

Examples

```
# Prior information for the reference group
x <- c(315,375,356,374,412,418,445,403,431,410,391,475,379)
# generate data for treatment group based on a shift effect
y <- x - 20

# calculate sample size
ssp <- WMWssp(x, y, alpha = 0.05, power = 0.8, t = 1/2)
summary(ssp)
```

`WMWssp_maximize` *Maximizing power for a given Type I error rate and prior information x and y*

Description

This function maximizes the power of the Wilcoxon-Mann-Whitney test for a given total sample size N and type-I error rate with respect to the allocation rate t = n_1/N.

Usage

```
WMWssp_maximize(x, y, alpha = 0.05, N)
```

Arguments

`x`	a vector of prior information for the first group
`y`	a vector of prior information for the second group
`alpha`	Type I error rate
`N`	total sample size

Value

Returns an object from class WMWssp containing

`result`	A dataframe with the results.
`t`	The optimal allocation rate.
`alpha`	The type-I error rate which was used.
`power`	The maximized power.
`N`	The total sample size which was used.

Examples

```
# Prior information for the reference group
x <- c(315,375,356,374,412,418,445,403,431,410,391,475,379)
# generate data for treatment group based on a shift effect
y <- x - 20

#
N <- 112

# calculate optimal t
ssp <- WMWssp_maximize(x, y, alpha = 0.05, N)
summary(ssp)
```

`WMWssp_minimize` *Minimizing samplesize for a given Type I and II error rate and prior information x and y*

Description

This function minimizes the sample size for a given power and type-I error rate with respect to the allocation rate t = n_1/N.

Usage

```
WMWssp_minimize(x, y, alpha = 0.05, power = 0.8, simulation = FALSE,
  nsim = 10^4)
```

Arguments

`x`	a vector of prior information for the first group
`y`	a vector of prior information for the second group
`alpha`	Type I error rate
`power`	Power to detect a relative effect based on the prior information
`simulation`	TRUE if a power simulation should be carried out
`nsim`	number of simulations for the power simulation

Value

Returns an object from class WMWssp containing

result	A dataframe with the results.
t	The optimal allocation rate for minimizing the sample size.
alpha	The type-I error rate which was used.
power	The power which was used.
N	The minimized sample size.

# Prior information for the reference group
x <- c(315,375,356,374,412,418,445,403,431,410,391,475,379)
# generate data for treatment group based on a shift effect
y <- x - 20

# calculate optimal t
ssp <- WMWssp_minimize(x, y, alpha = 0.05, power = 0.8)
summary(ssp)
```

WMWssp_noether *Sample size calculation for the Wilcoxon-Mann-Whitney test using the Noether formula*

Description

This function calculates the sample size for given type-I and type-II error probabilities using Noether's formula. If ties are present then prior information is needen.

Usage

```
WMWssp_noether(alpha, power, t, p, x = c(0), ties = FALSE)
```

Arguments

alpha	two sided type I error rate
power	power: detect a relative effect p at least with the specified power
t	proportion of subjects in the first group (between 0 and 1)
p	relative effect
x	prior information is only needed in case of ties
ties	TRUE if ties are possible (non continuous distribution), otherwise FALSE

Value

Returns an object from class WMWssp containing

result	A dataframe with the results.
t	The allocation rate which was used.
alpha	The type-I error rate which was used.
power	The power which was used.
N	The sample size needed.
