Package 'ecmwfr'

August 17, 2022

Title Interface to 'ECMWF' and 'CDS' Data Web Services

Version 1.4.0

Description Programmatic interface to the European Centre for Medium-Range Weather Forecasts dataset web services (ECMWF; <https://www.ecmwf.int/>) and Copernicus's Climate Data Store (CDS; <https://cds.climate.copernicus.eu>). Allows for easy downloads of weather forecasts and climate reanalysis data in R.

R topics documented:

`wf_archetype` *Creates an archetype function*

Description

Creates a universal MARS / CDS formatting function, in ways similar to `wf_modify_request()` but the added advantage that you could code for the use of dynamic changes in the parameters provided to the resulting custom function.

Usage

```
wf_archetype(request, dynamic_fields)
```

Arguments

`request`	a MARS or CDS request as an R list object.
`dynamic_fields`	character vector of fields that could be changed.

Details

Contrary to a simple replacement as in `wf_modify_request()` the generated functions are considered custom user written. Given the potential for complex formulations and formatting commands NO SUPPORT for the resulting functions can be provided. Only the generation of a valid function will be guaranteed and tested for.

Value

a function that takes ‘dynamic_fields‘ as arguments and returns a request as an R list object.

Examples

```
## Not run:
# format an archetype function
ERAI <- wf_archetype(
  request = list(stream = "oper",
                 levtype = "sfc",
                 param = "165.128/166.128/167.128",
```

```
                  dataset = "interim",
                  step = "0",
                  grid = "0.75/0.75",
                  time = "00/06/12/18",
                  date = "2014-07-01/to/2014-07-31",
                  type = "an",
                  class = "ei",
                  area = "73.5/-27/33/45",
                  format = "netcdf",
                  target = "tmp.nc"),
  dynamic_fields = c("date", "time")
)

# print output of the function with below parameters
str(ERA_interim("20100101", 3, 200))

## End(Not run)
```

`wf_check_request` *check ECMWF / CDS data requests*

Description

Check the validaty of a data request, and login credentials.

Usage

```
wf_check_request(user, request)
```

Arguments

`user`	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by `wf_set_key`
`request`	nested list with query parameters following the layout as specified on the ECMWF API page

Value

a data frame with the determined service and url service endpoint

Author(s)

Koen Hufkens

See Also

`wf_set_key` `wf_transfer`,`wf_request`

wf_datasets *ECMWF dataset list*

Description

Returns a list of datasets

Usage

```
wf_datasets(user, service = "webapi", simplify = TRUE)
```

Arguments

user	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by wf_set_key
service	which service to use, one of webapi, cds or ads (default = webapi)
simplify	simplify the output, logical (default = TRUE)

Value

returns a nested list or data frame with the ECMWF datasets

Author(s)

Koen Hufkens

See Also

wf_set_key wf_transfer wf_request

Examples

```
## Not run:
# set key
wf_set_key(email = "test@mail.com", key = "123")

# get a list of services
wf_services("test@mail.com")

# get a list of datasets
wf_datasets("test@mail.com")

## End(Not run)
```

wf_delete *delete ECMWF request*

Description

Deletes a staged download from the queue

Usage

```
wf_delete(url, user, service = "webapi", verbose = TRUE)
```

Arguments

url	url to query
user	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by wf_set_key
service	which service to use, one of webapi, cds or ads (default = webapi)
verbose	show feedback on processing

Author(s)

Koen Hufkens

wf_set_key wf_transfer wf_request

Examples

```
## Not run:
# set key
wf_set_key(email = "test@mail.com", key = "123")

# get key
wf_get_key(email = "test@mail.com")

## End(Not run)
```

wf_get_key *Get secret ECMWF / CDS token*

Description

Returns you token set by wf_set_key

Usage

```
wf_get_key(user, service = "webapi")
```

Arguments

user	user (email address) used to sign up for the ECMWF data service
service	which service to use, one of webapi, cds or ads (default = webapi)

Value

the key set using wf_set_key saved in the keychain

Author(s)

Koen Kufkens

See Also

wf_set_key

Examples

```
## Not run:
# set key
wf_set_key(user = "test@mail.com", key = "123")

# get key
wf_get_key(user = "test@mail.com")

## End(Not run)
```

wf_product_info *Renders product lists for a given dataset and data service*

Description

Shows and returns detailed product information about a specific data set (see wf_datasets).

Usage

```
wf_product_info(dataset, user, service = "webapi", simplify = TRUE)
```

Arguments

dataset	character, name of the data set for which the product information should be loaded.
user	string, user ID used to sign up for the CDS / ADS data service, used to retrieve the token set by wf_set_key.
service	which service to use, one of webapi, cds or ads (default = webapi)
simplify	boolean, default TRUE. If TRUE the description will be returned as tidy data instead of a nested list.

Value

Downloads a tidy data frame with product descriptions from CDS. If simplify = FALSE a list with product details will be returned.

Author(s)

Reto Stauffer, Koen Hufkens

See Also

wf_datasets.

Examples

```
## Not run:
   # Open description in browser
   wf_product_info(NULL, "reanalysis-era5-single-levels")

   # Return information
   info <- wf_product_info(NULL,
    "reanalysis-era5-single-levels", show = FALSE)
   names(info)

## End(Not run)
```

wf_request *ECMWF data request and download*

Description

Stage a data request, and optionally download the data to disk. Alternatively you can only stage requests, logging the request URLs to submit download queries later on using wf_transfer. Note that the function will do some basic checks on the request input to identify possible problems.

Usage

```
wf_request(
  request,
  user,
  transfer = TRUE,
  path = tempdir(),
  time_out = 3600,
  job_name,
  verbose = TRUE
)

wf_request_batch(
  request_list,
  workers = 2,
  user,
  path = tempdir(),
  time_out = 3600,
  total_timeout = length(request_list) * time_out/workers
)
```

Arguments

request	nested list with query parameters following the layout as specified on the ECMWF APIs page
user	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by wf_set_key
transfer	logical, download data TRUE or FALSE (default = TRUE)
path	path were to store the downloaded data
time_out	how long to wait on a download to start (default = 3*3600 seconds).
job_name	optional name to use as an RStudio job and as output variable name. It has to be a syntactically valid name.
verbose	show feedback on processing
request_list	a list of requests that will be processed in parallel.
workers	maximum number of simultaneous request that will be submitted to the service. Most ECMWF services are limited to 20 concurrent requests (default = 2).
total_timeout	overall timeout limit for all the requests in seconds.

Value

the path of the downloaded (requested file) or the an R6 object with download/transfer information

Author(s)

Koen Hufkens

See Also

wf_set_key wf_transfer

Examples

```
## Not run:
# set key
wf_set_key(user = "test@mail.com", key = "123")

request <- list(stream = "oper",
   levtype = "sfc",
   param = "167.128",
   dataset = "interim",
   step = "0",
   grid = "0.75/0.75",
   time = "00",
   date = "2014-07-01/to/2014-07-02",
   type = "an",
   class = "ei",
   area = "50/10/51/11",
   format = "netcdf",
   target = "tmp.nc")

# demo query
wf_request(request = request, user = "test@mail.com")

# Run as an RStudio Job. When finished, will create a
# variable named "test" in your environment with the path to
# the downloaded file.
wf_request(request = request, user = "test@mail.com", job_name = "test")

## End(Not run)
```

---

wf_services *ECMWF services list*

Description

Returns a list of services

Usage

```
wf_services(user, simplify = TRUE)
```

Arguments

user	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by wf_set_key
simplify	simplify the output, logical (default = TRUE)

Value

returns a nested list or data frame with the ECMWF services

See Also

wf_set_key wf_transfer wf_request

Examples

```
## Not run:
# set key
wf_set_key(user = "test@mail.com", key = "123")

# get a list of services
wf_services("test@mail.com")

# get a list of datasets
wf_services("test@mail.com")

## End(Not run)
```

---

wf_set_key *Set secret ECMWF token*

Description

Saves the token to your local keychain under a service called "ecmwfr".

Usage

```
wf_set_key(user, key, service)
```

Arguments

user	user (email address) used to sign up for the ECMWF data service
key	token provided by ECMWF
service	which service to use, one of webapi, cds or ads

Details

In systems without keychain management set the option keyring_backend to ‘file‘ (i.e. options(keyring_backend = "file")) in order to write the keychain entry to an encrypted file. This mostly pertains to headless Linux systems. The keychain files can be found in ~/.config/r-keyring.

Value

It invisibly returns the user.

wf_get_key

Examples

```
## Not run:
# set key
wf_set_key(user = "test@mail.com", key = "123")

# get key
wf_get_key(user = "test@mail.com")

# leave user and key empty to open a browser window to the service's website
# and type the key interactively
wf_get_key()

## End(Not run)
```

---

wf_transfer *ECMWF data transfer function*

Description

Returns the contents of the requested url as a NetCDF file downloaded to disk or the current status of the requested transfer.

Usage

```
wf_transfer(
  url,
  user,
  service = "webapi",
```

```
  path = tempdir(),
  filename = tempfile("ecmwfr_", tmpdir = ""),
  verbose = TRUE
)
```

Arguments

url	R6 wf_request) query output
user	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by wf_set_key.
service	which service to use, one of webapi, cds or ads (default = webapi)
path	path were to store the downloaded data
filename	filename to use for the downloaded data
verbose	show feedback on data transfers

Value

a netCDF of data on disk as specified by a wf_request

Author(s)

Koen Hufkens

See Also

wf_set_key wf_request

Examples

```
## Not run:
# set key
wf_set_key(user = "test@mail.com", key = "123")

# request data and grab url and try a transfer
r <- wf_request(request, "test@email.com", transfer = FALSE)

# check transfer, will download if available
wf_transfer(r$get_url(), "test@email.com")

## End(Not run)
```

wf_user_info *ECMWF WebAPI user info query*

Description

Returns user info for the ECMWF WebAPI

Usage

```
wf_user_info(user)
```

Arguments

user	user (email address) used to sign up for the ECMWF data service, used to retrieve the token set by wf_set_key

Value

returns a data frame with user info

See Also
