

# Package ‘hotspot’

October 23, 2015

**Type** Package

**Title** Software Hotspot Analysis

**Version** 1.0

**Date** 2015-10-22

**Author** Csaba Farago

**Maintainer** Csaba Farago <farago@inf.u-szeged.hu>

**Description**

Contains data for software hotspot analysis, along with a function performing the analysis itself.

**License** GPL (>= 2)

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2015-10-23 18:26:11

## R topics documented:

hotspot-package . . . . .	1
hotspot.data . . . . .	2
perform.hotspot.tests . . . . .	3

---

hotspot-package	<i>Software Hotspot Analysis</i>
-----------------	----------------------------------

---

## Description

Contains data for software hotspot analysis, along with a function performing the analysis itself.

## Details

The package contains results of hotspot analysis of some open source system, and a function which performs the test itself. See [hotspot.data](#) for details about the input data, and [perform.hotspot.tests](#) for the execution of tests.

**Author(s)**

Csaba Farago <farago@inf.u-szeged.hu>

hotspot.data

*Hotspot Data*

---

**Description**

Contains data for hotspot analysis. It contains information about version control based hotspot calculation, relative maintainability indexes and number of post release bugs per source file basis, of 14 versions of 4 open source systems.

**Usage**

```
data("hotspot.data")
```

**Format**

The format is the following:

The first level is a list of 4 elements, each representing an open source software: Ant, JEdit, Log4J and Xerces.

The second level is also a list, the elements represent the version of the system. These are the following (in the format of reference):

- hotspot.data\$Ant\$"1.3"
- hotspot.data\$Ant\$"1.4"
- hotspot.data\$Ant\$"1.5"
- hotspot.data\$Ant\$"1.6"
- hotspot.data\$Ant\$"1.7"
- hotspot.data\$JEdit\$"4.0"
- hotspot.data\$JEdit\$"4.1"
- hotspot.data\$JEdit\$"4.2"
- hotspot.data\$JEdit\$"4.3"
- hotspot.data\$Log4J\$"1.0"
- hotspot.data\$Log4J\$"1.1"
- hotspot.data\$Log4J\$"1.2"
- hotspot.data\$Xerces\$"1.3"
- hotspot.data\$Xerces\$"1.4"

The third level is a data frame of 4 columns:

- name (string): the fully qualified name of the source code element (e.g. org.apache.tools.ant.AntClassLoader).

- hotspot (real number in interval [0.0, 1.0]): the hotspot number calculated based on code ownership and cumulative code churn values, using Hotspot Detector (<https://github.com/maintainability/hotspot>). Higher value indicates more intensive past modifications and/or lack of clear ownership. See the 2 articles by Farago et al. (2015) for details.
- rmi (real number): relative maintainability index of the Java class. It was calculated using the Columbus Quality Model. Higher number indicates better maintainability. See articles by Bakota et al. (2011) and Hegedus et al. (2013) for details.
- bug (integer): number of post-release bugs. It was downloaded from Promise database (<http://openscience.us/repo/defect/>).

---

perform.hotspot.tests *Perform Hotspot Tests*

---

## Description

Performs correlation tests between hotspot numbers and RMI numbers, and between hotspot numbers and number of post-release bugs.

## Details

The input is the `hotspot.data`, found in this package. The result is a data table, containing the project name, the version, the comparison (i.e. if that is RMI or bug), the resulting p-value and the resulting rho.

## Examples

```
data(hotspot.data)
perform.hotspot.tests(hotspot.data)
```
