

# Package ‘ib’

April 5, 2022

**Type** Package

**Title** Bias Correction via Iterative Bootstrap

**Version** 0.2.0

**Description** An implementation of the iterative bootstrap procedure of Kuk (1995) <[doi:10.1111/j.2517-6161.1995.tb02035.x](https://doi.org/10.1111/j.2517-6161.1995.tb02035.x)> to correct the estimation bias of a fitted model object. This procedure has better bias correction properties than the bootstrap bias correction technique.

**Maintainer** Samuel Orso <[Samuel.Orso@unige.ch](mailto:Samuel.Orso@unige.ch)>

**Depends** R (>= 4.0.0)

**Imports** betareg, lme4, Formula, MASS, Matrix, methods, Rdpack (>= 0.7), stats, utils, VGAM

**Suggests** testthat (>= 3.0.0), knitr, nlraa, rmarkdown

**License** GPL (>= 2)

**Encoding** UTF-8

**RdMacros** Rdpack

**RoxygenNote** 7.1.2

**URL** <https://github.com/SMAC-Group/ib/>

**BugReports** <https://github.com/SMAC-Group/ib/issues/>

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** Samuel Orso [aut, cre],  
Stéphane Guerrier [ctb],  
Yuming Zhang [ctb]

**Repository** CRAN

**Date/Publication** 2022-04-04 22:50:02 UTC

bootstrap

*Parametric bootstrap***Description**

Method for generating parametric bootstrap estimates from a fitted model.

**Usage**

```
bootstrap(object, B = 1000, extra_param = FALSE, ...)
```

**Arguments**

object            an object representing a fitted model (see 'Details').  
 B                an integer for number of bootstrap replicates (default 1,000).  
 extra\_param     if TRUE, bootstrap is also performed for extra parameters (see 'Details').  
 ...             additional optional arguments to pass to `ibControl`.

**Details**

This method is a simple wrapper around the `ib` method where number of iterations is set to 1.

**Value**

A matrix  $p$  (size of parameter) times  $B$  of bootstrapped estimates.

**Author(s)**

Samuel Orso

ib	<i>Bias correction via iterative bootstrap</i>
----	--

---

**Description**

ib is used to correct the bias of a fitted model object with the iterative bootstrap procedure.

**Usage**

```
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

## S4 method for signature 'betareg'
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

## S4 method for signature 'glm'
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

## S4 method for signature 'lm'
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

## S4 method for signature 'lmerMod'
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

## S4 method for signature 'nls'
```

```

ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

## S4 method for signature 'vglm'
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

```

### Arguments

**object** an object representing a fitted model (see 'Details').

**thetastart** an optional starting value for the iterative procedure. If NULL (default), the procedure starts at the estimates in object.

**control** a list of parameters for controlling the iterative procedure (see [ibControl](#)).

**extra\_param** if TRUE, the bias of estimation of extra parameters is performed (see 'Details').

**...** additional optional arguments (see 'Details').

### Details

The iterative bootstrap procedure is described in Kuk (1995) and further studied by Guerrier et al. (2019) and Guerrier et al. (2020). The  $k$ th iteration of this algorithm is

$$\hat{\theta}^k = \hat{\theta}^{k-1} + \hat{\pi} - \frac{1}{H} \sum_{h=1}^H \hat{\pi}_h(\hat{\theta}^{k-1})$$

for  $k = 1, 2, \dots$  and where the sum is over  $h = 1, \dots, H$ . The estimate  $\hat{\pi}$  is provided by the object. The value  $\hat{\pi}_h(\hat{\theta})$  is a parametric bootstrap estimate where the bootstrap sample is generated from  $\hat{\theta}$  and a fixed seed (see [ibControl](#)). The greater the parameter value  $H$  generally the better bias correction but the more computation it requires (see [ibControl](#)). If `thetastart=NULL`, the initial value of the procedure is  $\hat{\theta}^0 = \hat{\pi}$ . The number of iterations are controlled by `maxit` parameter of [ibControl](#).

By default, the method correct [coefficients](#) only. For extra parameters, it depends on the model. These extra parameters may have some constraints (e.g. positivity). If `constraint=TRUE` (see [ibControl](#)), then a transformation from the constraint space to the real is used for the update.

For [betareg](#), `extra_param` is not available as by default mean and precision parameters are corrected. Currently the 'identity' link function is not supported for precision parameters.

For [glm](#), if `extra_param=TRUE`: the shape parameter for the [Gamma](#), the variance of the residuals in [lm](#) or the overdispersion parameter of the negative binomial regression in [glm.nb](#), are also corrected. Note that the [quasi](#) families are not supported for the moment as they have no simulation method (see [simulate](#)). Bias correction for extra parameters of the [inverse.gaussian](#) is not yet implemented.

For [lm](#), if `extra_param=TRUE`: the variance of the residuals is also corrected. Note that using the `ib` is not useful as coefficients are already unbiased, unless one considers different data generating mechanism such as censoring, missing values and outliers (see [ibControl](#)).

For [lmer](#), by default, only the fixed effects are corrected. If `extra_param=TRUE`: all the random effects (variances and correlations) and the variance of the residuals are also corrected. Note that using the `ib` is certainly not useful with the argument `REML=TRUE` in [lmer](#) as the bias of variance components is already addressed, unless one considers different data generating mechanism such as censoring, missing values and outliers (see [ibControl](#)).

For `nls`, if `extra_param=TRUE`: the variance of the residuals is also corrected.

For `vglm`, `extra_param` is currently not used. Indeed, the philosophy of a vector generalized linear model is to potentially model all parameters of a distribution with a linear predictor. Hence, what would be considered as an extra parameter in `glm` for instance, may already be captured by the default coefficients. However, correcting the bias of a coefficients does not imply that the bias of the parameter of the distribution is corrected (by **Jensen's inequality**), so we may use this feature in a future version of the package. Note that we currently only support distributions with a `simslot` (see `simulate.vlm`).

### Value

A fitted model object of class `lb`.

### Author(s)

Samuel Orso

ib,negbin-method      [ib](#) method for negbin object from [glm.nb](#) function of **MASS** package.

---

## Description

[ib](#) method for negbin object from [glm.nb](#) function of **MASS** package.

## Usage

```

## S4 method for signature 'negbin'
ib(object, thetastart = NULL, control = list(...), extra_param = FALSE, ...)

```

## Arguments

object	an object representing a fitted model (see 'Details').
thetastart	an optional starting value for the iterative procedure. If NULL (default), the procedure starts at the estimates in object.
control	a list of parameters for controlling the iterative procedure (see <a href="#">ibControl</a> ).

extra\_param if TRUE, the bias of estimation of extra parameters is performed (see 'Details').  
 ... additional optional arguments (see 'Details').

---

IbBetareg-class      *An S4 class union for ib*

---

### Description

Members of the union are [IbBetareg](#), [IbGlm](#), [IbLm](#), [IbLmer](#), [IbNegbin](#), [IbNls](#), [IbVglm](#)

### Details

The 'Functions' section describes members of the class union.

### Value

Each member of the union has a slot with the initial object corrected by the `ib` (see [getObject](#)) and a second slot with extra meta data from `ib` (see [getExtra](#)).

### Functions

- `IbBetareg-class`: fitted model by `betareg` from **betareg**
- `IbGlm-class`: fitted model by `glm` from **stats**
- `IbLm-class`: fitted model by `lm` from **stats**
- `IbLmer-class`: fitted model by `lmer` from **lme4**
- `IbNegbin-class`: fitted model by `glm.nb` from **MASS**
- `IbNls-class`: fitted model by `nls` from **stats**
- `IbVglm-class`: fitted model by `vglm` from **VGAM**

ibControl	<i>Auxiliary for controlling IB</i>
-----------	-------------------------------------

---

### Description

Auxiliary function for `ib` bias correction.

### Usage

```
ibControl(
  tol = 1e-05,
  maxit = 25,
  verbose = FALSE,
  seed = 123L,
  H = 1L,
  constraint = TRUE,
  early_stop = FALSE,
  cens = FALSE,
  right = NULL,
  left = NULL,
  mis = FALSE,
  prop = NULL,
  out = FALSE,
  eps = NULL,
  G = NULL,
  func = function(x) rowMeans(x, na.rm = T),
  sim = NULL
)
```

### Arguments

<code>tol</code>	positive convergence tolerance $\epsilon$ . The <code>ib</code> procedure converges when $\ \hat{\theta}^{k+1} - \hat{\theta}^k\ _2/p < \epsilon$ , where $p$ is the dimension of $\theta$ .
<code>maxit</code>	integer representing the maximal number of iterations.
<code>verbose</code>	if TRUE, it prints some output in the console at each iteration.
<code>seed</code>	integer to set the seed (see <a href="#">Random</a> ).
<code>H</code>	integer representing the number of bootstrap estimates (see <code>ib</code> ).
<code>constraint</code>	if TRUE (default), constraint for <code>extra_param</code> is used in the iterative procedure (see 'Details' of <code>ib</code> ).
<code>early_stop</code>	if TRUE (default is FALSE), the iterative procedure stops as soon as there is no improvement in the minimization of the objective function (see 'Details' of <code>ib</code> ).
<code>cens</code>	if TRUE the simulated responses are censored according to <code>left</code> and <code>right</code> values.
<code>right</code>	double for right-censoring (only used if <code>cens=TRUE</code> ).

<code>left</code>	double for left-censoring (only used if <code>cens=TRUE</code> ).
<code>mis</code>	if <code>TRUE</code> the simulated responses have missing data at random.
<code>prop</code>	double between 0 and 1 representing the proportion of missing data (only used if <code>mis=TRUE</code> ).
<code>out</code>	if <code>TRUE</code> the simulated responses are also generated with a contamination mechanism.
<code>eps</code>	double between 0 and 1 representing the proportion of outliers in the data (only used if <code>out=TRUE</code> ).
<code>G</code>	a function to generate outliers. It takes only a sample size as argument.
<code>func</code>	a function to reduce the H bootstrap estimates (rowwise). By default, the average is computed. The user can supply a function. One could imagine using other function such as the median or a trimmed mean.
<code>sim</code>	a user-defined function for simulating responses (see 'Details')

**Details**

`sim` allows the user to provide its own function for generating responses. Currently it is only supported for generalized linear models with the prototype `'fun(object, control, extra_param, ...)`' (see [ib](#)).

**Value**

a list with components named as the arguments.

**See Also**

[ib](#), the iterative procedure for bias correction.

### Usage

```
## S4 method for signature 'vglm'
simulation(object, control = list(...), extra_param = NULL, ...)
```

### Arguments

object	an object of class <a href="#">IbVglm</a>
control	a list of parameters for controlling the iterative procedure (see <a href="#">ibControl</a> ).
extra_param	NULL by default; extra parameters to pass to simulation.
...	further arguments

---

summary,IbBetareg-method

*Summarizing a beta regression fit corrected by the iterative bootstrap*

---

### Description

summary method for class [IbBetareg](#)

### Usage

```
## S4 method for signature 'IbBetareg'  
summary(object, ...)
```

### Arguments

object            an object of class [IbBetareg](#)  
...               further arguments passed to `summary.betareg`

### See Also

[summary.betareg](#)

---

summary,IbGlm-method

*Summarizing a Generalized Linear Model regression fit corrected by the iterative bootstrap*

---

### Description

summary method for class [IbGlm](#)

### Usage

```
## S4 method for signature 'IbGlm'  
summary(object, ...)
```

### Arguments

object            an object of class [IbGlm](#)  
...               further arguments passed to `summary.glm`

### See Also

[summary.glm](#)

---

summary,IbLm-method    *Summarizing a linear regression fit corrected by the iterative bootstrap*

---

### Description

summary method for class [IbLm](#)

### Usage

```
## S4 method for signature 'IbLm'
summary(object, ...)
```

### Arguments

object            an object of class [IbLm](#)  
 ...              further arguments passed to `summary.lm`

### See Also

[summary.lm](#)

---

summary,IbLmer-method    *Summarizing a linear mixed model regression fit corrected by the iterative bootstrap*

---

### Description

summary method for class [IbLmer](#)

### Usage

```
## S4 method for signature 'IbLmer'
summary(object, ...)
```

### Arguments

object            an object of class [IbLmer](#)  
 ...              further arguments passed to `summary.merMod` of **lme4**

---

summary,IbNegbin-method

*Summarizing a negative binomial regression fits corrected by the iterative bootstrap*

---

### Description

summary method for class [IbNegbin](#)

### Usage

```
## S4 method for signature 'IbNegbin'  
summary(object, ...)
```

### Arguments

object            an object of class [IbNegbin](#)  
...                further arguments passed to `summary.negbin`

### See Also

[summary.negbin](#)

---

summary,IbNls-method

*Summarizing a nonlinear regression fit corrected by the iterative bootstrap*

---

### Description

summary method for class [IbNls](#)

### Usage

```
## S4 method for signature 'IbNls'  
summary(object, ...)
```

### Arguments

object            an object of class [IbNls](#)  
...                further arguments passed to `summary.nls` of **stats**

---

summary,IbVglm-method *Summarizing a vector generalized linear model regression fit corrected by the iterative bootstrap*

---

### Description

summary method for class [IbVglm](#)

### Usage

```
## S4 method for signature 'IbVglm'
summary(object, ...)
```

### Arguments

object            an object of class [IbVglm](#)  
 ...                further arguments passed to `summary.merMod` of **VGAM**

---

SummaryIbBetareg-class

*An S4 class union for summary*

---

### Description

Members of the union are [SummaryIbBetareg](#), [SummaryIbGlm](#), [SummaryIbLm](#), [SummaryIbLmer](#), [SummaryIbNegbin](#), [SummaryIbNls](#), [SummaryIbVglm](#) iterative bootstrap procedure

### Details

The ‘Functions’ section describes members of the class union.

### Functions

- [SummaryIbBetareg-class](#): summary of class `summary.betareg` from **betareg**
- [SummaryIbGlm-class](#): summary of class `summary.glm` from **stats**
- [SummaryIbLm-class](#): summary of class `summary.lm` from **stats**
- [SummaryIbLmer-class](#): summary of class `summary.merMod` from **lme4**
- [SummaryIbNegbin-class](#): summary of class `summary.negbin` from **MASS**
- [SummaryIbNls-class](#): summary of class `summary.nls` from **stats**
- [SummaryIbVglm-class](#): summary of class `summary.vglm` from **VGAM**

vcov,Ib-method	<i>Method for calculating covariance matrix from an object in class union "Ib"</i>
----------------	--

---

**Description**

Method for calculating covariance matrix from an object in class union "Ib"

**Usage**

```
## S4 method for signature 'Ib'  
vcov(object, ...)
```

**Arguments**

object	an object of class union "Ib"
...	further arguments to pass to vcov

**See Also**

[Ib](#), [vcov](#)
