

Package ‘inops’

November 19, 2019

Title Infix Operators for Detection, Subsetting and Replacement

Version 0.0.1

Description Infix operators to detect, subset, and replace the elements matched by a given condition. The functions have several variants of operator types, including subsets, ranges, regular expressions and others.

Implemented operators work on vectors, matrices, and lists.

comparison_replace	<i>Replacing Values by Comparison</i>
--------------------	---------------------------------------

Description

Operators for replacing values using the standard comparison operators.

Usage

```
x >= y <- value
```

```
x > y <- value
```

```
x <= y <- value
```

```
x < y <- value
```

```
x == y <- value
```

```
x != y <- value
```

Arguments

x	first element of the operation.
y	second element of the operation.
value	replacement value.

Details

Thanks to these operators :

- `x == y <-value` is equivalent to `x[x == y] <-value`
- `x != y <-value` is equivalent to `x[x != y] <-value`
- `x <= y <-value` is equivalent to `x[x <= y] <-value`
- `x >= y <-value` is equivalent to `x[x >= y] <-value`
- `x < y <-value` is equivalent to `x[x < y] <-value`
- `x > y <-value` is equivalent to `x[x > y] <-value`

Value

x with values for which the comparisons evaluate to TRUE replaced with value.

See Also

```
\==\`
```

Examples

```
ages <- c(130, 10, 1996, 21, 39, 74, -2, 0)

ages == 1996 <- as.numeric(format(Sys.Date(), "%Y")) - 1986
ages

ages > 100 <- NA
ages

ages <= 0 <- NA
ages
```

comparison_subset *Subsetting Values by Comparison*

Description

Operators for subsetting values using the standard comparison operators.

Usage

```
x %[>=% y
x %[%>% y
x %[%<=% y
x %[%<% y
x %[%==% y
x %[%!=% y
```

Arguments

x	first element of the operation.
y	second element of the operation.

Value

elements of x matched by the used comparison.

See Also

```
`==`
```

Examples

```
ages <- c(130, 10, 21, 39, 74, -2, 0)
ages %<% 5
```

```
letters %[% "a"
```

```
letters %!=% "a"
```

in_detect

Matching Values and Intervals

Description

Operators for detecting which values are within a given interval or set.

Usage

```
x %in{}% table
```

```
x %out{}% table
```

```
x %in[]% interval
```

```
x %out[]% interval
```

```
x %in()% interval
```

```
x %out()% interval
```

```
x %in[]% interval
```

```
x %out[]% interval
```

```
x %in[]% interval
```

```
x %out[]% interval
```

```
x %in~% pattern
```

```
x %out~% pattern
```

```
x %in~p% pattern
```

```
x %out~p% pattern
```

```
x %in~f% pattern
```

x %out~f% pattern

x %in#% count

x %out#% count

Arguments

x	vector or array of values to be matched.
table	vector or list to be matched against.
interval	numeric vector defining a range to be matched against.
pattern	pattern to be matched against.
count	numeric vector defining counts for count-based selection.

Details

Compared with default %in% implementation in R the operators implemented here try to be more consistent with other default infix operators like == and <. In particular they preserve the dimensions and the missing values (see examples).

Style of parentheses define the type of matching template:

- %in{}% detects which elements of x are present in the set given by the table argument.
- %in(%), %in[]%, %in[]% and %in[]% detect the elements of x included in a range of interval argument, using range(interval). This range being closed, open on both sides, open on the left, or open on the right, respectively.
- %in~%, %in~p% and %in~f% detect the elements of x that match the regular expression given by pattern. They wrap grepl() with the default parameters of perl = TRUE, and with fixed = TRUE, respectively.
- %in#% detects the elements that occur a specified number of times. Operators of the form %out<suffix>% return the negation of %in<suffix>%

Value

a logical vector or an array of the same dimensions as x indicating if each value of x is within the defined subset.

See Also

%in%

Examples

```
# difference in behaviour with dimensions when compared to %in%
iris[1:10,] %in% "setosa"
iris[1:10,] == "setosa"
iris[1:10,] %in{}% "setosa"
```

```

# difference in behaviour with missing values when compared to %in%
x <- c(1,2,3,NA,4)
x %in% c(1,2,3)
x %in{}% c(1,2,3)

# other interval operators
x <- 1:10
x %in[]% c(3,7)
x %in()% c(3,7)
x %in[]% c(3,7)
x %in[]% c(3,7)
x %out[]% c(3,7)

# when more than 2 numbers are provided for the interval - range is used
x <- 1:10
all.equal(x %in[]% c(2,4), x %in[]% c(2,3,4))
all.equal(x %in[]% c(2,4), x %in[]% range(c(2,3,4)))

# matching according to regular expressions
iris$Species %in~% "^v"
iris$Species %in~f% "^v"
iris$Species %in~f% "versicolor"
iris$Species %in~f% c("versicolor", "virginica")

# selecting by number of occurrences
mtcars$gear %in#% 1:5
mtcars$gear %out#% 1:5

```

in_replace

Replacing Values and Intervals

Description

Operators for replacing values within a given interval or set.

Usage

```

x %in{}% table <- value

x %out{}% table <- value

x %in[]% interval <- value

x %out[]% interval <- value

x %in()% interval <- value

x %out()% interval <- value

```

```
x %in([]) interval <- value
x %out([]) interval <- value
x %in[] interval <- value
x %out[] interval <- value
x %in~% pattern <- value
x %out~% pattern <- value
x %in~f% pattern <- value
x %out~f% pattern <- value
x %in~p% pattern <- value
x %out~p% pattern <- value
x %in% table <- value
x %out% table <- value
x %in#% count <- value
x %out#% count <- value
```

Arguments

x	vector or array of values to be matched.
table	vector or list to be matched against.
value	replacement value.
interval	numeric vector defining a range to be matched against.
pattern	pattern to be matched against.
count	numeric vector defining counts for count-based selection.

Details

For each %*%<- operator of this package `x %*% y <-value` is a shorthand for `x[x %*% y] <-value`.

Value

x with specified values replaced with value.

See Also

`%in{}%`

Examples

```
# interval replacement operators
x <- 1:10
x %in[]% c(3,7) <- 0
x

x <- 1:10
x %in[]% c(3,7) <- NA
x

x <- 1:10
x %out[]% c(3,7) <- x
x

# regular expression replacement operators
region <- as.character(state.region)
table(region)
region %in~% "^North" <- "North"
table(region)

# count based replacement operators
carb <- mtcars$carb
table(carb, useNA="always")
carb %in#% 1 <- NA
table(carb, useNA="always")
```

in_subset

Subsetting Values and Intervals

Description

Operators for subsetting values within a given interval or set.

Usage

```
x %[in{}% table
x %[out{}% table
x %[in[]% interval
x %[out[]% interval
x %[in()% interval
x %[out()% interval
```

x %[in(]% interval
 x %[out(]% interval
 x %[in[]% interval
 x %[out[]% interval
 x %[in~% pattern
 x %[out~% pattern
 x %[in~p% pattern
 x %[out~p% pattern
 x %[in~f% pattern
 x %[out~f% pattern
 x %[in% table
 x %[out% table
 x %[in#% count
 x %[out#% count

Arguments

x	vector or array of values to be matched.
table	vector or list to be matched against.
interval	numeric vector defining a range to be matched against.
pattern	pattern to be matched against.
count	numeric vector defining counts for count-based selection.

Details

For each %[*% operator of this package x %[*% y is a shorthand for x[x %[*% y].

Value

elements of x matched by the used infix operator type.

See Also

%in{}%

Examples

```
# interval subsetting operators
x <- 1:10
x %[in[]% c(3,7)
x %[in[]% c(3,7)
x %[out[]% c(3,7)

# regular expression subsetting operators
carnames <- rownames(mtcars)
carnames %[in~% "^Mazda"
carnames %[in~% c("^Mazda", "^Merc")
carnames %[in~% c("\\w{10,100}$") # long car names

# count-based subsetting operators
mtcars$ cyl %[in#% 1:10
mtcars$ cyl %[out#% 1:10
```

out

Detect values that don't match

Description

`%out%` is the negation of `%in%`, so `x %out% y` is equivalent to `! x %in% y`.

Usage

```
x %out% table
```

Arguments

`x` vector of values to be matched.
`table` vector or list to be matched against.

Value

a logical vector or of the same length as `x` indicating if each value of `x` is within the defined subset.

See Also

`%in%`

Examples

```
iris$Species %[in% c("setosa", "versicolor")
iris$Species %[out% c("setosa", "versicolor")
```
