Package 'interleave'

March 18, 2021

Type Package

Title Converts Tabular Data to Interleaved Vectors

Version 0.1.1

Date 2021-03-18

Description Converts matrices and lists of matrices into a single vector by interleaving their values. That is, each element of the result vector is filled from the input matrices one row at a time. This is the same as transposing a matrix, then removing the dimension attribute, but is designed to operate on matrices in nested list structures.

R topics documented:

interleave *Interleave*

Description

Converts matrices and lists of matrices into a vector. The elements of the vector are taken from the matrices one row at a time.

Usage

```
interleave(x)
```

Arguments

x	object to interleave

Value

vector of interleaved values

Examples

```
## matrix (this is equivalent to a LINESTRING in spatial structures)
m1 <- matrix(1:20, ncol = 2, byrow = TRUE )
interleave( m1 )

## This is the same as transposing and removing the 'dim' attribute
tm <- t(m1)
attr( tm, "dim" ) <- NULL
all( interleave( m1 ) == tm )

## list of matrices (this is equivalent to a POLYGON in spatial structures)
m2 <- matrix(20:1, ncol = 2, byrow = TRUE )
l <- list( m1, m2 )
interleave( l )

## nested list of matrices
l <- list( m1, list( list( m2 ) ) )
interleave( l )
```
