

Package ‘wrappedtools’

September 1, 2022

Type Package

Title Useful Wrappers Around Commonly Used Functions

Description The main functionalities of 'wrappedtools' are:

adding backticks to variable names; rounding to desired precision
with special case for p-values;
selecting columns based on pattern and storing their position, name,
and backticked name; computing and formatting of descriptive statistics
(e.g. mean±SD), comparing groups and creating publication-ready tables with
descriptive statistics and p-values; creating specialized plots for
correlation matrices. Functions were mainly written for my own daily work or
teaching, but may be of use to others as well.

Version 0.8.0

Date 2022-09-01

Maintainer Andreas Busjahn <andreas@busjahn.net>

License GPL-3

Encoding UTF-8

Imports stats, boot, knitr, coin, utils, dplyr,forcats, purrr, glue,
rlang, stringr, magrittr, ggplot2, tibble, tidyR, kableExtra,
lifecycle

Depends R (>= 3.5), tidyverse

RoxygenNote 7.2.1

LazyData true

VignetteBuilder knitr

Suggests rmarkdown, testthat

NeedsCompilation no

bt	<i>Add backticks to names or remove them</i>
----	--

Description

`bt` adds leading and trailing backticks to make illegal variable names usable. Optionally removes them.

Usage

```
bt(x, remove = FALSE)
```

Arguments

x	Names to add backtick to.
remove	Option to remove existing backticks, default=FALSE.

Value

Character vector with backticks added.

Examples

```
bt('name 1')
```

cat_desc_stats	<i>Compute absolute and relative frequencies.</i>
----------------	---

Description

cat_desc_stats computes absolute and relative frequencies for categorical data with a number of formatting options.

Usage

```
cat_desc_stats(
  source = NULL,
  separator = " ",
  return_level = TRUE,
  ndigit = 0,
  groupvar = NULL,
  singleline = FALSE,
  percent = TRUE,
  prettynum = FALSE,
  .german = FALSE,
  quelle = NULL
)
```

Arguments

source	Data for computation. Previously "quelle".
separator	delimiter between results per level, preset as ' '.
return_level	Should levels be reported?
ndigit	Digits for rounding of relative frequencies.

groupvar	Optional grouping factor.
singleline	Put all group levels in a single line?
percent	Logical, add percent-symbol after relative frequencies?
prettyNum	logical, apply prettyNum to results?
.german	logical, should "." and "," be used as bigmark and decimal? Sets prettyNum to TRUE.
quelle	deprecated, retained for compatibility, use 'source' instead.

Value

Structure depends on parameter return_level: if FALSE than a tibble with descriptives, otherwise a list with two tibbles with levels of factor and descriptives. If parameter singleline is FALSE (default), results for each factor level is reported in a separate line, otherwise they are pasted. Number of columns for result tibbles is one or number of levels of the additional grouping variable.

Examples

```
cat_desc_stats(mtcars$gear)
cat_desc_stats(mtcars$gear, return_level = FALSE)
cat_desc_stats(mtcars$gear, groupvar = mtcars$am)
cat_desc_stats(mtcars$gear, groupvar = mtcars$am, singleline = TRUE)
```

cn	<i>Shortcut for colnames()</i>
----	--------------------------------

Description

cn lists column names, by default for variable rawdata.

Usage

```
cn(data = rawdata)
```

Arguments

data	Data structure to read column names from.
------	---

Value

Character vector with column names.

Examples

```
cn(mtcars)
```

compare2numvars	<i>Comparison for columns of numbers for 2 groups</i>
-----------------	---

Description

`compare2numvars` computes either `t_var_test` or `wilcox.test`, depending on parameter `gaussian`. Descriptive statistics, depending on distribution, are reported as well.

Usage

```
compare2numvars(
  data,
  dep_vars,
  indep_var,
  gaussian,
  round_p = 3,
  round_desc = 2,
  range = FALSE,
  rangesep = " ",
  pretext = FALSE,
  mark = FALSE,
  n = FALSE,
  add_n = FALSE
)
```

Arguments

<code>data</code>	name of dataset (tibble/data.frame) to analyze.
<code>dep_vars</code>	vector of column names for independent variables.
<code>indep_var</code>	name of grouping variable, has to translate to 2 groups. If more levels are encountered, an error is produced.
<code>gaussian</code>	logical specifying normal or ordinal values.
<code>round_p</code>	level for rounding p-value.
<code>round_desc</code>	number of significant digits for rounding of descriptive stats.
<code>range</code>	include min/max?
<code>rangesep</code>	text between statistics and range or other elements.
<code>pretext</code>	for function <code>formatP</code> .
<code>mark</code>	for function <code>formatP</code> .
<code>n</code>	create columns for n per group?
<code>add_n</code>	add n to descriptive statistics?

Value

A tibble with variable names, descriptive statistics, and p-value, number of rows is number of `dep_vars`.

Examples

```
# Assuming Normal distribution:
compare2numvars(
  data = mtcars, dep_vars = c("wt", "mpg", "qsec"), indep_var = "am",
  gaussian = TRUE
)
# Ordinal scale:
compare2numvars(
  data = mtcars, dep_vars = c("wt", "mpg", "qsec"), indep_var = "am",
  gaussian = FALSE
)
# If dependent variable has more than 2 levels, consider fct_lump:
mtcars %>% mutate(gear=factor(gear) %>% fct_lump_n(n=1)) %>%
  compare2numvars(dep_vars="wt",indep_var="gear",gaussian=TRUE)
```

compare2qualvars *Comparison for columns of factors for 2 groups*

Description

compare2qualvars computes [fisher.test](#) with simulated p-value and descriptive statistics for a group of categorical dependent variables.

Usage

```
compare2qualvars(
  data,
  dep_vars,
  indep_var,
  round_p = 3,
  round_desc = 2,
  pretext = FALSE,
  mark = FALSE,
  singleline = FALSE,
  spacer = " ",
  linebreak = "\n"
)
```

Arguments

<code>data</code>	name of data set (tibble/data.frame) to analyze.
<code>dep_vars</code>	vector of column names for dependent variables.
<code>indep_var</code>	name of grouping variable, has to translate to 2 groups.
<code>round_p</code>	level for rounding p-value.
<code>round_desc</code>	number of significant digits for rounding of descriptive stats.

pretext	for function <code>formatP</code> .
mark	for function <code>formatP</code> .
singleline	Put all group levels in a single line?
spacer	Text element to indent levels and fill empty cells, defaults to " ".
linebreak	place holder for newline.

Value

A tibble with variable names, descriptive statistics, and p-value, number of rows is number of dep_vars.

Examples

```
compare2qualvars(
  data = mtcars, dep_vars = c("gear", "cyl", "carb"), indep_var = "am",
  spacer = " "
)
compare2qualvars(
  data = mtcars, dep_vars = c("gear", "cyl", "carb"), indep_var = "am",
  spacer = " ", singleline = TRUE
)
```

Description

Some names were changed in August 2022, to reflect the update of the function to handle ordinal data using non-parametric equivalents.

Usage

```
compare_n_numvars(
  .data = rawdata,
  dep_vars,
  indep_var,
  gaussian,
  round_desc = 2,
  range = FALSE,
  rangesep = " ",
  pretext = FALSE,
  mark = FALSE,
  round_p = 3,
  add_n = FALSE
)
```

Arguments

.data	name of dataset (tibble/data.frame) to analyze, defaults to rawdata.
dep_vars	vector of column names.
indep_var	name of grouping variable.
gaussian	Logical specifying normal or ordinal indep_var (and chooses comparison tests accordingly)
round_desc	number of significant digits for rounding of descriptive stats.
range	include min/max?
rangesep	text between statistics and range or other elements.
pretext, mark	for function formatP.
round_p	level for rounding p-value.
add_n	add n to descriptive statistics?

Value

A list with elements "results": tibble with descriptive statistics, p-value from ANOVA/Kruskal-Wallis test, p-values for pairwise comparisons, significance indicators, and descriptives pasted with significance. "raw": nested list with output from all underlying analyses.

Examples

```
# Usually, only the result table is relevant:
compare_n_numvars(
  .data = mtcars, dep_vars = c("wt", "mpg", "hp"),
  indep_var = "drat",
  gaussian = TRUE
)$results
# For a report, result columns may be filtered as needed:
compare_n_numvars(
  .data = mtcars, dep_vars = c("wt", "mpg", "hp"),
  indep_var = "cyl",
  gaussian = FALSE
)$results %>%
  dplyr::select(Variable, `cyl 4 fn`:`cyl 8 fn`, multivar_p)
```

compare_n_qualvars	<i>Comparison for columns of factors for more than 2 groups with post-hoc</i>
--------------------	---

Description

Comparison for columns of factors for more than 2 groups with post-hoc

Usage

```
compare_n_qualvars(
  data,
  dep_vars,
  indep_var,
  round_p = 3,
  round_desc = 2,
  pretext = FALSE,
  mark = FALSE,
  singleline = FALSE,
  spacer = " ",
  linebreak = "\n",
  prettynum = FALSE
)
```

Arguments

data	name of data set (tibble/data.frame) to analyze.
dep_vars	vector of column names.
indep_var	name of grouping variable.
round_p	level for rounding p-value.
round_desc	number of significant digits for rounding of descriptive stats
pretext	for function formatP
mark	for function formatP
singleline	Put all group levels in a single line?
spacer	Text element to indent levels, defaults to " ".
linebreak	place holder for newline.
prettynum	Apply prettyNum to results?

Value

A tibble with variable names, descriptive statistics, and p-value of [fisher.test](#) and [pairwise_fisher_test](#), number of rows is number of dep_vars.

Examples

```
# Separate lines for each factor level:
compare_n_qualvars(
  data = mtcars, dep_vars = c("am", "cyl", "carb"), indep_var = "gear",
  spacer = " "
)
# All levels in one row but with linebreaks:
compare_n_qualvars(
  data = mtcars, dep_vars = c("am", "cyl", "carb"), indep_var = "gear",
  singleline = TRUE
)
```

```
# All levels in one row, separatedeted by ";":
compare_n_qualvars(
  data = mtcars, dep_vars = c("am", "cyl", "carb"), indep_var = "gear",
  singleline = TRUE, linebreak = "; "
)
```

cortestR*Correlations with significance***Description**

cortestR computes correlations and their significance level based on [cor.test](#). Coefficients and p-values may be combined or reported separately.

Usage

```
cortestR(
  cordata,
  method = "pearson",
  digits = 3,
  digits_p = 3,
  sign_symbol = TRUE,
  split = FALSE,
  space = ""
)
```

Arguments

cordata	data frame or matrix with rawdata.
method	as in cor.test.
digits	rounding level for estimate.
digits_p	rounding level for p value.
sign_symbol	If true, use significance indicator instead of p-value.
split	logical, report correlation and p combined (default) or split in list.
space	character to fill empty upper triangle.

Value

Depending on parameters split and sign_symbol, either a single data frame with coefficient and p-values or significance symbols or a list with two data frames.

Examples

```
# with defaults
cortestR(mtcars[, c("wt", "mpg", "qsec")], split = FALSE, sign_symbol = TRUE)
# separate coefficients and p-values
cortestR(mtcars[, c("wt", "mpg", "qsec")], split = TRUE, sign_symbol = FALSE)
```

faketrial*Results from a simulated clinical trial with interaction effects.*

Description

A dataset containing physiological data, biomarkers, and categorical data.

Usage

```
faketrial
```

Format

A tibble with 300 rows and 24 variables:

Sex Sex of animal, factor with levels 'female', 'male'

Agegroup Factor with levels 'young', 'middle', 'old'

Treatment Factor with levels 'sham', 'OP'

HR Heart rate

sysRR,diaRR Systolic and diastolic blood pressure

Med xxx Pseudo-medications, factors with levels 'y', 'n'

Biomarker x units Biomarkers with log-normal distribution

FindVars*Find numeric index and names of columns based on patterns*

Description

FindVars looks up colnames (by default for data-frame rawdata) based on parts of names, using regular expressions. Be warned that special characters as e.g. [(need to be escaped or replaced by . Exclusion rules may be specified as well.

Usage

```
FindVars(
  varnames,
  allnames = colnames(rawdata),
  exact = FALSE,
  exclude = NA,
  casesensitive = TRUE,
  fixed = FALSE,
  return_symbols = FALSE
)
```

Arguments

<code>varnames</code>	Vector of pattern to look for.
<code>allnames</code>	Vector of values to detect pattern in; by default, <code>colnames(rawdata)</code> .
<code>exact</code>	Partial matching or exact only (adding ^ and \$)?
<code>exclude</code>	Vector of pattern to exclude from found names.
<code>casesensitive</code>	Logical if case is respected in matching (default FALSE: <code>a<>A</code>)
<code>fixed</code>	Logical, match as is, argument is passed to <code>grep()</code> .
<code>return_symbols</code>	Should names be reported as symbols additionally? (Default FALSE)

Value

A list with index, names, backticked names, and symbols

Examples

```
FindVars(varnames = c("^c", "g"), allnames = colnames(mtcars))
FindVars(varnames = c("^c", "g"), allnames = colnames(mtcars), exclude = "r")
rawdata <- mtcars
FindVars(varnames = c("^c", "g"))
```

`formatP`

Re-format p-values, avoiding rounding to 0 and adding surprisal if requested

Description

`formatP` simplifies p-values by rounding to the maximum of p or a predefined level. Optionally < or = can be added, as well as symbols according to significance level.

Usage

```
formatP(
  pIn,
  ndigits = 3,
  textout = TRUE,
  pretext = FALSE,
  mark = FALSE,
  german_num = FALSE,
  add.surprisal = FALSE,
  sprecision = 1
)
```

Arguments

pIn	A numeric vector or matrix with p-values.
ndigits	Number of digits (default=3).
textout	Cast output to character (default=TRUE)?
pretext	Should = or < be added before p (default=FALSE)?
mark	Should significance level be added after p (default=FALSE)?
german_num	change dot (default) to comma?
add.surprisal	Add surprisal aka Shannon information to p-value (default=FALSE)?
sprecision	Rounding level for surprisal (default=1).

Value

vector or matrix (depending on type of pIn) with type character (default) or numeric, depending on parameter textout

Examples

```
formatP(0.012345)
formatP(0.012345, add.surprisal = TRUE)
formatP(0.012345, ndigits = 4)
formatP(0.000122345, ndigits = 3, pretext = TRUE)
```

ggcormat

Print graphical representation of a correlation matrix.

Description

ggcormat makes the same correlation matrix as [corTestR](#) and graphically represents it in a plot

Usage

```
ggcormat(
  cor_mat,
  p_mat = NULL,
  method = "Correlation",
  title = "",
  maxpoint = 2.1,
  textsize = 5,
  axistextsize = 2,
  titlesize = 3,
  breaklabels = NULL,
  lower_only = TRUE,
  .low = "blue3",
  .high = "red2",
  .legendtitle = NULL
)
```

Arguments

<code>cor_mat</code>	correlation matrix as produced by <code>cor</code> .
<code>p_mat</code>	Optional matrix of p-values; if provided, this is used to define size of dots rather than absolute correlation.
<code>method</code>	text specifying type of correlation.
<code>title</code>	plot title.
<code>maxpoint</code>	maximum for <code>scale_size_manual</code> , may need adjustment depending on <code>plotsize</code> .
<code>textsize</code>	for theme text.
<code>axistextsize</code>	relative text size for axes.
<code>titlesize</code>	as you already guessed, relative text size for title.
<code>breaklabels</code>	currently not used, intended for <code>str_wrap</code> .
<code>lower_only</code>	should only lower triangle be plotted?
<code>.low</code>	Color for heatmap.
<code>.high</code>	Color for heatmap.
<code>.legendtitle</code>	Optional name for color legend.

Value

A ggplot object, allowing further styling.

Examples

```
coeff_pvalues <- corcontestR(mtcars[, c("wt", "mpg", "qsec", "hp")],  
    split = TRUE, sign_symbol = FALSE  
)  
# focus on coefficients:  
ggcormat(cor_mat = coeff_pvalues$corout, maxpoint = 5)  
# size taken from p-value:  
ggcormat(  
    cor_mat = coeff_pvalues$corout,  
    p_mat = coeff_pvalues$pout, maxpoint = 5)
```

Description

`glm_CI` computes and formats of CIs for `glm`.

Usage

```
glmCI(model, min = .01, max = 100, cisep = '\u0000022ef', ndigit=2)
```

Arguments

model	Output from glm .
min, max	Lower and upper limits for CIs, useful for extremely wide CIs.
cisep	Separator between CI values.
ndigit	rounding level.

Value

A list with coefficient, CIs, and pasted coef([CIs]).

Examples

```
glm_out <- glm(am ~ mpg, family = binomial, data = mtcars)
glmCI(glm_out)
```

ksnormal

*Kolmogorov-Smirnov-Test against Normal distribution***Description**

ksnormal is a convenience function around [ks.test](#), testing against Normal distribution

Usage

```
ksnormal(x)
```

Arguments

x	Vector of data to test.
---	-------------------------

Value

p.value from [ks.test](#).

Examples

```
# original ks.test:
ks.test(
  x = mtcars$wt, pnorm, mean = mean(mtcars$wt, na.rm = TRUE),
  sd = sd(mtcars$wt, na.rm = TRUE)
)
# wrapped version:
ksnormal(x = mtcars$wt)
```

logrange_1*Predefined sets of labels for plots with log-scaled axes***Description**

`logrange_1` returns a vector for log-labels at .1, 1, 100, 1000 ...

Usage

```
logrange_1
logrange_5
logrange_123456789
logrange_12357
logrange_15
```

Format

An object of class `numeric` of length 41.
 An object of class `numeric` of length 738.
 An object of class `numeric` of length 369.
 An object of class `numeric` of length 205.
 An object of class `numeric` of length 82.

Value

`numeric` vector
`numeric` vector

Functions

- `logrange_5`: vector for log-labels at 1.0, 1.5, 2.0, 2.5 ... 10, 15, 20, 25 ...
- `logrange_123456789`: vector for log-labels at 1, 2, 3 ... 9, 10, 20, 30 ... 90, 100 ...
- `logrange_12357`: vector for log-labels at 1 ,2, 3, 5, 7, 10, 20 ,30, 50, 70 ...
- `logrange_15`: vector for log-labels at 1, 5, 10, 50 ...

Examples

```
ggplot(mtcars, aes(wt, mpg)) +
  geom_point() +
  scale_y_log10(breaks = logrange_5)
ggplot(mtcars, aes(wt, mpg)) +
  geom_point() +
  scale_y_log10(breaks = logrange_123456789)
```

markSign*Convert significance levels to symbols*

Description

`markSign` returns the symbol associated with a significance level.

Usage

```
markSign(SignIn, plabel = c("n.s.", "+", "*", "**", "***"))
```

Arguments

<code>SignIn</code>	A single p-value.
<code>pLabel</code>	A translation table, predefined with the usual symbols.

Value

factor with label as defined in `pLabel`.

Examples

```
markSign(0.012)
```

meansd*Compute mean and sd and put together with the \pm symbol.*

Description

Compute mean and sd and put together with the \pm symbol.

Usage

```
meansd(  
  x,  
  roundDig = 2,  
  drop0 = FALSE,  
  groupvar = NULL,  
  range = FALSE,  
  rangesep = " ",  
  add_n = FALSE,  
  .german = FALSE  
)
```

Arguments

x	Data for computation.
roundDig	Number of relevant digits for roundR.
drop0	Should trailing zeros be dropped?
groupvar	Optional grouping variable for subgroups.
range	Should min and max be included in output?
rangesep	How should min/max be separated from mean+sd?
add_n	Should n be included in output?
.german	logical, should "." and "," be used as bigmark and decimal?

Value

character vector with mean \pm SD, rounded to desired precision

Examples

```
# basic usage of meansd
meansd(x = mtcars$wt)
# with additional options
meansd(x = mtcars$wt, groupvar = mtcars$am, add_n = TRUE)
```

meanse

Compute mean and standard error of mean and put together with the \pm symbol.

Description

meanse computes SEM based on Standard Deviation/square root(n)

Usage

```
meanse(x, mult = 1, roundDig = 2, drop0 = FALSE)
```

Arguments

x	Data for computation.
mult	multiplier for SEM, default 1, can be set to e.g. 2 or 1.96 to create confidence intervals
roundDig	Number of relevant digits for roundR.
drop0	Should trailing zeros be dropped?

Value

character vector with mean \pm SEM, rounded to desired precision

Examples

```
# basic usage of meanse  
meanse(x = mtcars$wt)
```

medianse*Compute standard error of median.*

Description

medianse is based on [mad](#)/square root(n)

Usage

```
medianse(x)
```

Arguments

x Data for computation.

Value

numeric vector with SE Median.

Examples

```
# basic usage of medianse  
medianse(x = mtcars$wt)
```

median_cl_boot*Compute confidence interval of median by bootstrapping.*

Description

median_cl_boot computes lower and upper confidence limits for the estimated median, based on bootstrapping.

Usage

```
median_cl_boot(x, conf = 0.95, type = "basic", nrepl = 10^3)
```

Arguments

x	Data for computation.
conf	confidence interval with default 95%.
type	type for function boot.ci.
nrepl	number of bootstrap replications, defaults to 1000.

Value

A tibble with one row and three columns: Median, CIlow, CIhigh.

Examples

```
# basic usage of median_cl_boot
median_cl_boot(x = mtcars$wt)
```

median_quart

Compute median and quartiles and put together.

Description

Compute median and quartiles and put together.

Usage

```
median_quart(
  x,
  nround = NULL,
  probs = c(0.25, 0.5, 0.75),
  qtype = 8,
  roundDig = 2,
  drop0 = FALSE,
  groupvar = NULL,
  range = FALSE,
  rangesep = " ",
  rangearrow = " -> ",
  prettynum = FALSE,
  .german = FALSE,
  add_n = FALSE
)
```

Arguments

x	Data for computation.
nround	Number of digits for fixed round.
probs	Quantiles to compute.
qtype	Type of quantiles.
roundDig	Number of relevant digits for roundR.
drop0	Should trailing zeros be dropped?
groupvar	Optional grouping variable for subgroups.
range	Should min and max be included in output?
rangesep	How should min/max be separated from mean+sd?

rangearrow	What is put between min -> max?
prettynum	logical, apply prettyNum to results?
.german	logical, should "." and "," be used as bigmark and decimal?
add_n	Should n be included in output?

Value

character vector with median [1stQuartile/3rdQuartile], rounded to desired precision

Examples

```
# basic usage of median_quart
median_quart(x = mtcars$wt)
# with additional options
median_quart(x = mtcars$wt, groupvar = mtcars$am, add_n = TRUE)
data(faketrial)
median_quart(x=faketrial$`Biomarker 1 [units]`,groupvar = faketrial$Treatment)
```

pairwise_fisher_test *Pairwise Fisher's exact tests*

Description

pairwise_fisher_test calculates pairwise comparisons between group levels with corrections for multiple testing.

Usage

```
pairwise_fisher_test(
  dep_var,
  indep_var,
  adjmethod = "fdr",
  plevel = 0.05,
  symbols = letters[-1],
  ref = FALSE
)
```

Arguments

dep_var	dependent variable, containing the data.
indep_var	independent variable, should be factor or coercible.
adjmethod	method for adjusting p values (see p.adjust).
plevel	threshold for significance.
symbols	predefined as b,c, d...; provides footnotes to mark group differences, e.g. b means different from group 2
ref	is the 1st subgroup the reference (like in Dunnett test)?

Value

A list with elements "methods" (character), "p.value" (matrix), "plevel" (numeric), and "sign_colwise" (vector of length number of levels - 1)

Examples

```
# All pairwise comparisons
pairwise_fisher_test(dep_var = mtcars$cyl, indep_var = mtcars$gear)
# Only comparison against reference gear=3
pairwise_fisher_test(dep_var = mtcars$cyl, indep_var = mtcars$gear, ref = TRUE)
```

pairwise_ordcat_test *Pairwise comparison for ordinal categories*

Description

`pairwise_ordcat_test` calculates pairwise comparisons for ordinal categories between all group levels with corrections for multiple testing.

Usage

```
pairwise_ordcat_test(
  dep_var,
  indep_var,
  adjmethod = "fdr",
  plevel = 0.05,
  symbols = letters[-1],
  ref = FALSE,
  cmh = TRUE
)
```

Arguments

<code>dep_var</code>	dependent variable, containing the data
<code>indep_var</code>	independent variable, should be factor
<code>adjmethod</code>	method for adjusting p values (see p.adjust)
<code>plevel</code>	threshold for significance
<code>symbols</code>	predefined as b,c, d...; provides footnotes to mark group differences, e.g. b means different from group 2
<code>ref</code>	is the 1st subgroup the reference (like in Dunnett test)
<code>cmh</code>	Should Cochran-Mantel-Haenszel test (cmh_test) be used for testing? If false, the linear-by-linear association test (lbl_test) is applied.

Value

A list with elements "methods" (character), "p.value" (matrix), "plevel" (numeric), and "sign_colwise" (vector of length number of levels - 1)

Examples

```
# All pairwise comparisons
mtcars2 <- mutate(mtcars, cyl = factor(cyl, ordered = TRUE))
pairwise_ordcat_test(dep_var = mtcars2$cyl, indep_var = mtcars2$gear)
# Only comparison against reference gear=3
pairwise_ordcat_test(dep_var = mtcars2$cyl, indep_var = mtcars2$gear, ref = TRUE)
```

pairwise_t_test *Extended pairwise t-test*

Description

`pairwise_t_test` calculate pairwise comparisons between group levels with corrections for multiple testing based on [pairwise.t.test](#)

Usage

```
pairwise_t_test(
  dep_var,
  indep_var,
  adjmethod = "fdr",
  plevel = 0.05,
  symbols = letters[-1]
)
```

Arguments

<code>dep_var</code>	dependent variable, containing the data
<code>indep_var</code>	independent variable, should be factor
<code>adjmethod</code>	method for adjusting p values (see p.adjust)
<code>plevel</code>	threshold for significance
<code>symbols</code>	predefined as b,c, d...; provides footnotes to mark group differences, e.g. b means different from group 2

Value

A list with method output of `pairwise.t.test`, matrix of p-values, and character vector with significance indicators.

Examples

```
pairwise_t_test(dep_var = mtcars$wt, indep_var = mtcars$cyl)
```

`pairwise_wilcox_test` *Pairwise Wilcoxon tests*

Description

`pairwise_wilcox_test` calculates pairwise comparisons on ordinal data between all group levels with corrections for multiple testing based on [wilcox_test](#) from package 'coin'.

Usage

```
pairwise_wilcox_test(
  dep_var,
  indep_var,
  strat_var = NA,
  adjmethod = "fdr",
  distr = "exact",
  plevel = 0.05,
  symbols = letters[-1],
  sep = ""
)
```

Arguments

<code>dep_var</code>	dependent variable, containing the data.
<code>indep_var</code>	independent variable, should be factor.
<code>strat_var</code>	optional factor for stratification.
<code>adjmethod</code>	method for adjusting p values (see p.adjust)
<code>distr</code>	Computation of p-values, see wilcox_test .
<code>plevel</code>	threshold for significance.
<code>symbols</code>	predefined as b,c, d...; provides footnotes to mark group differences, e.g. b means different from group 2.
<code>sep</code>	text between statistics and range or other elements.

Value

A list with matrix of adjusted p-values and character vector with significance indicators.

Examples

```
pairwise_wilcox_test(dep_var = mtcars$wt, indep_var = mtcars$cyl)
```

pdf_kable	<i>Enhanced kable with latex</i>
-----------	----------------------------------

Description

`pdf_kable` formats tibbles/df's for markdown

Usage

```
pdf_kable(  
  .input,  
  width1 = 6,  
  twidth = 14,  
  tposition = "left",  
  innercaption = NULL,  
  caption = "",  
  foot = NULL,  
  escape = TRUE  
)
```

Arguments

.input	table to print
width1	Width of 1st column, default 6.
twidth	Default 14
tposition	Default left
innercaption	subheader
caption	header
foot	footnote
escape	see kable

Value

A character vector of the table source code.

print_kable*Enhanced kable with definable number of rows/columns for splitting***Description****[Superseded]****Usage**

```
print_kable(t, nrows = 30, caption = "", ncols = 100, ...)
```

Arguments

t	table to print.
nrows	number of rows (30) before splitting.
caption	header.
ncols	number of columns (100) before splitting.
...	Further arguments passed to kable .

Details

package `flextable` is a more powerful alternative

`print_kable` formats and prints tibbles/df's in markdown with splitting into sub-tables with repeated caption and header.

Value

No return value, called for side effects.

Examples

```
## Not run:
print_kable(mtcars, caption = "test")

## End(Not run)
```

roundR*Automatic rounding to a reasonable length, based on largest number*

Description

roundR takes a vector or matrix of numbers and returns rounded values with selected precision and various formatting options.

Usage

```
roundR(  
  roundin,  
  level = 2,  
  smooth = FALSE,  
  textout = TRUE,  
  drop0 = FALSE,  
  .german = FALSE,  
  .bigmark = FALSE  
)
```

Arguments

roundin	A vector or matrix of numbers.
level	A number specifying number of relevant digits to keep.
smooth	A logical specifying if you want rounding before the dot (e.g. 12345 to 12300).
textout	A logical if output is converted to text.
drop0	A logical if trailing zeros should be dropped.
.german	A logical if german numbers should be reported.
.bigmark	A logical if big.mark is to be shown, mark itself depends on parameter .german.

Value

vector of type character (default) or numeric, depending on parameter textout.

Examples

```
roundR(1.23456, level = 3)  
roundR(1.23456, level = 3, .german = TRUE)  
roundR(1234.56, level = 2, smooth = TRUE)
```

SEM *Standard Error of Mean.*

Description

SEM computes standard error of mean.

Usage

`SEM(x)`

Arguments

x Data for computation.

Value

numeric vector with SEM.

Examples

```
SEM(x = mtcars$wt)
```

se_median *Compute standard error of median*

Description

`se_median` is based on `mad`/square root(`n`) (Deprecated, please see `medianse`, which is the same but named more consistently)

Usage

`se_median(x)`

Arguments

x Data for computation.

Value

numeric vector with SE Median.

Examples

```
# basic usage of se_median
## Not run:
se_median(x = mtcars$wt)

## End(Not run)
```

surprisal

Compute surprisal aka Shannon information from p-values

Description

surprisal takes p-values and returns s, a value representing the number of consecutive heads on a fair coin, that would be as surprising as the p-value

Usage

```
surprisal(p, precision = 1)
```

Arguments

p	a vector of p-values
precision	rounding level with default 1

Value

a character vector of s-values

tab.search

Search within data.frame or tibble

Description

tab.search searches for pattern within a data-frame or tibble, returning column(s) and row(s)

Usage

```
tab.search(searchdata = rawdata, pattern, find.all = T, names.only = FALSE)
```

Arguments

searchdata	table to search in, predefined as rawdata
pattern	regex, for exact matches add ^findme\$
find.all	return all row indices or only 1st per column,default=TRUE
names.only	return only vector of colnames rather than list with names and rows, default=FALSE

30 *var_coeff*

Value

A list with numeric vectors for each column giving row numbers of matched elements

t_var_test

Independent sample t-test with test for equal variance

Description

t_var_test tests for equal variance based on [var.test](#) and calls t.test, setting the option var.equal accordingly.

Usage

```
t_var_test(data, formula, cutoff = 0.05)
```

Arguments

data	Tibble or data_frame.
formula	Formula object with dependent and independent variable.
cutoff	is significance threshold for equal variances.

Value

A list from [t.test](#)

Examples

```
t_var_test(mtcars, wt ~ am)
# may be used in pipes:
mtcars %>% t_var_test(wt ~ am)
```

var_coeff

Compute coefficient of variance.

Description

var_coeff computes relative variability as standard deviation/mean *100

Usage

```
var_coeff(x)
```

Arguments

x	Data for computation.
---	-----------------------

Value

numeric vector with coefficient of variance.

Examples

```
var_coeff(x = mtcars$wt)
```
